LAB REPORT

on

Artificial Intelligence (23CS5PCAIN)

Submitted by

ANU SAI SHREE R (1BM23CS045)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU-560019

Aug 2025 to Dec 2025

**B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019**
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried out by **ANU SAI SHREE R(1BM23CS045)**, who is a bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

Dr. K. R. Mamatha Associate Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

Index

Sl. No.	Program Title	Page No.
1	Implement Tic –Tac –Toe Game Implement vacuum cleaner agent	1-8
2	Implement Iterative deepening search algorithm	9-12
3	Implement A* search algorithm	13-21
4	Implement Hill Climbing search algorithm to solve N-Queens problem	22-24
5	Simulated Annealing to Solve 8-Queens problem	25-27
6	Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.	28-30
7	Implement unification in first order logic	31-34
8	Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.	35-39
9	Create a knowledge base consisting of first order logic statements and prove the given query using Resolution	40-46
10	Implement Alpha-Beta Pruning.	47-49

Program 1

1.1 Implement Tic - Tac - Toe Game

Algorithm:

classmate
Date _____
Page _____

WORK - 1

1. Tic Tac Toe game
- Algorithm:
 - 1: Start
 - 2: Initialize a 3x3 board with empty spaces
 - 3: Assign computer as player "O"
Human as player "X"
 - 4: Display the game board
 - 5: Allow user ^{human} to inter click on the cell
 - 6: If the cell is available
mark "X" on the select cell
else
provide winner message and ask again
 - 7: If found consecutive '3' X as row/column/diagonal
print "you win"
 - else
computer is given control
 - 8: If board is full
print "Draw"
computer's turn
 - 9: Call the BestMovefunc()
BestMovefunc(board)
best score = -∞;
place 'O'
move to the first available position
MaxScore(board, 'O')
score = MaxScore(board, 'O')
if score < best score
update and go to
- 10: BestMovefunc(board)
best score = -∞;
for every available position board
Place 'O'
call Minimax(board, depth, isMaximizing)
~~return MaxScore(board, 'O')~~
if under the move
if score > best score
best score = score
position = p
return position as best score
- 11: place 'O' at best move position
- 12: Display the board
- 13: If computer wins → print "computer win!" → stop
- 14: If the board is full → print "Draw" → stop
- 15: Minimax(board, depth, isMaximizing)
If "O" wins → return +1
If "X" wins → return -1
If board is full → return 0.
- 16: isMaximizing = True;
set best score = -∞
For each empty cell:
Place 'O'
recursively call Minimax with isMaximizing
false
Update best score = max(best score, score)
return best score
- 17: (human)
set best score = -∞
For each empty cell:
Place 'X'
recursively call Minimax with isMaximizing
= false

1.2 Implement vacuum cleaner agent

Algorithm:

2) Vacuum cleaner

1. Start

2. Assign the 4 quadrants as 0, 1, 2, 3 clockwise.

3. Initialize current quadrant as 0

4. for i = 0 to 3:
 if room is dirty
 clean.

5. end

Code:

```
def vacuum_cleaner():
    A = int(input("Enter state of A (0 for clean, 1 for dirty): "))
    B = int(input("Enter state of B (0 for clean, 1 for dirty): "))
    location = input("Enter location (A or B): ").upper()

    cost = 0
    state = {'A': A, 'B': B}

    if location == 'A':
        if state['A'] == 1: # If A is dirty
            print("Cleaned A.")
            state['A'] = 0
            cost += 1
        else:
            print("A is clean")

        if state['B'] == 1: # If B is dirty
            print("Moving vacuum right")
```

```

print("Cleaned B.")
state['B'] = 0
cost += 1
print("Is B clean now? (0 if clean, 1 if dirty):", state['B'])
print("Is A dirty? (0 if clean, 1 if dirty):", state['A'])
print("B is clean")
print("Moving vacuum left")
else:
    print("Turning vacuum off")

elif location == 'B':
    if state['B'] == 1: # If B is dirty
        print("Cleaned B.")
        state['B'] = 0
        cost += 1
    else:
        print("B is clean")

if state['A'] == 1: # If A is dirty
    print("Moving vacuum left")
    print("Cleaned A.")
    state['A'] = 0
    cost += 1
    print("Is A clean now? (0 if clean, 1 if dirty):", state['A'])
    print("Is B dirty? (0 if clean, 1 if dirty):", state['B'])
    print("A is clean")
    print("Moving vacuum right")
else:
    print("Turning vacuum off")

print("Cost:", cost)
print(state)

vacuum_cleaner()

```

OUTPUT Case1:

```
Enter state of A (0 for clean, 1 for dirty): 1
Enter state of B (0 for clean, 1 for dirty): 1
Enter location (A or B): A
Cleaned A.
Moving vacuum right
Cleaned B.
Is B clean now? (0 if clean, 1 if dirty): 0
Is A dirty? (0 if clean, 1 if dirty): 0
B is clean
Moving vacuum left
Cost: 2
{'A': 0, 'B': 0}
```

OUTPUT Case2:

```
Enter state of A (0 for clean, 1 for dirty): 0
Enter state of B (0 for clean, 1 for dirty): 1
Enter location (A or B): A
A is clean
Moving vacuum right
Cleaned B.
Is B clean now? (0 if clean, 1 if dirty): 0
Is A dirty? (0 if clean, 1 if dirty): 0
B is clean
Moving vacuum left
Cost: 1
{'A': 0, 'B': 0}
```

OUTPUT Case3:

```
Enter state of A (0 for clean, 1 for dirty): 0
Enter state of B (0 for clean, 1 for dirty): 0
Enter location (A or B): A
A is clean
Turning vacuum off
Cost: 0
{'A': 0, 'B': 0}
```

Program2

Implement 8 puzzle problems using Iterative Deepening Depth-First Search (IDDFS)

Algorithm:

10.2

8-puzzle using misplaced tiles and manhattan distance and IDDFS

Perform iterative deepening search (IDDFS)

```

graph TD
    A((A)) --> B((B))
    A --> C((C))
    B --> D((D))
    B --> E((E))
    B --> F((F))
    B --> G((G))
    D --> H((H))
    D --> I((I))
    D --> J((J))
    D --> K((K))
    style A fill:none,stroke:none
    style B fill:none,stroke:none
    style C fill:none,stroke:none
    style D fill:none,stroke:none
    style E fill:none,stroke:none
    style F fill:none,stroke:none
    style G fill:none,stroke:none
    style H fill:none,stroke:none
    style I fill:none,stroke:none
    style J fill:none,stroke:none
    style K fill:none,stroke:none
  
```

Step Depth IDDFS

0	A
1	ABC
2	ABDEC FG
3	ABDHIEJCFK

Algorithm:

- start with depth limit of 0.
- Perform DFS upto current depth limit
- if goal is found, end search
- increase depth limit by 1
- ~~iteratively~~ continue BFS for that depth limit till the destination node is reached.

8-puzzle problem

Annotations - The 8-puzzle problem has a 3x3 grid with numbering 1-8 and a blank space. The end goal is to solve the jumbled arrangement and find legit the end result.

Possible moves: up, down, left, right

Program3

Implement A* search algorithm

Algorithm:

lab - 3

Solve 8-puzzle problem using A* algorithm

A* algorithm:-

$$f(n) = g(n) + h(n)$$

$g(n)$ = no. of times blank tile moved from the source state

$h(n)$ = heuristic function i.e. no. of misplaced tiles

$f(n) = g(n) + h(n)$

$g(n) \rightarrow$ heuristic function is the manhattan distance

for each tile, calculate distance from its current position to the goal position.

$MD = |x_2 - x_1| + |y_2 - y_1|$.

Ex:-

1	2	3	$g=0$
-	4	6	$h=3$
7	5	8	

(up) (right) (down).

$g(n)=1$ $h=1+1+1+1$ $g=1$ $h=1+1+1+1$ $g=1$ $h=1+1+1+1$

$f=5$ $(f=3)$ $f=5$

1	2	3	
4	-	6	
7	5	8	

(up) (right) (down).

$g=2$ $h=3$ $g=2$ $h=8$ $g=2$ $h=3$ $g=2$ $h=1$

$f=5$ $f=5$ $f=5$ $f=5$ $(f=3)$

1	2	3	
4	5	6	
7	-	8	

(up) (right) (down).

~~seen~~ ~~10 times~~

1	2	3	
4	5	6	
7	8	-	

global state.

Program 5

Simulated Annealing to Solve 8-Queens problem

Algorithm:

5/10/25
classmate
Date _____
Page _____

Lab - 4.

N-queens using hill climbing.

Algorithm.

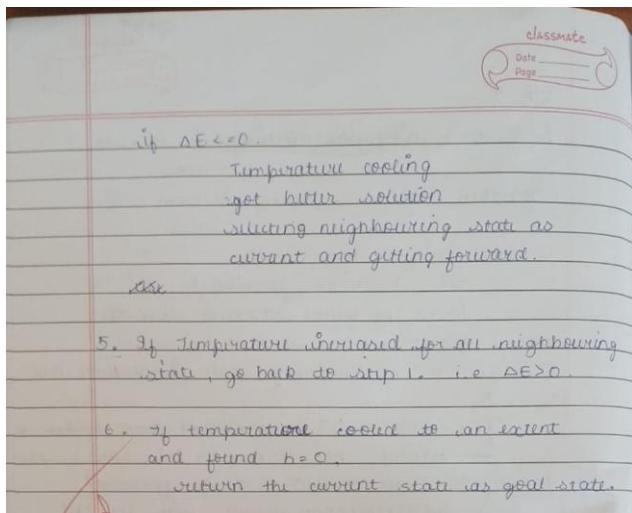

1. Start with random state.
2. calculate heuristic function h .
 $h = \text{no. of queens attacking each other}$
3. $\text{goal} \Rightarrow h = 0$.
4. generate neighbouring states & calculate it's h .
if neighbour's ' h ' is different from current state.
if $h < \text{current } h$, then select neighbour.
if no neighbour found with less ' h ' than current state. Go to step 1.
5. Repeat step 3 until $h = 0$.
if $h = 0$, return if has goal state.
current state.

Lab - 5.

N-queens using simulated annealing. \times

Algorithm.

1. Start with random state.
2. calculate heuristic function, h .
 $h = \text{no. of queens attacking each other}$
3. calculate ~~cooling~~ temperature.
Initialize the max temperature, $T = n$ (1000).
4. For each neighbouring state,
 $\Delta E = h(\text{heuristic of neighbouring state}) - h(\text{heuristic of current state})$.

Code:

```
import random
import math

Program 7

Implement unification in first order logic

Algorithm:

29/10/2025
CLASSMATE
Date _____
Page _____

MUR - 7

Unification using FOL

functions:

1. $P(f(x), g(y) + y)$
 $P(+g(z)), g(+a), f(a)$
 Find θ (most general unifier)
2. $Q(x, f(x))$
 $Q(f(y), y)$
3. $H(x, g(z))$
 $H(g(y), g(g(z)))$

Answers:

1. same predicate ✓
 $f(x) \neq f(g(z))$
 $\rightarrow x$ can be substituted by $g(z)$
 $g(y) \neq g(+a)$
 $\rightarrow y$ can be substituted by $+a$
 $y \neq +a$
 \rightarrow as above \leftarrow unification possible
 $P(+x) \neq P(g(z)), g(y) \neq g(+a), y \neq +a$.
2. same predicate ✓
 $x \neq f(y)$
 $\rightarrow x$ can be substituted by $f(y)$
 $f(x) = y$
 $f(x) \neq y$
 $\rightarrow f(f(y)) \neq y$ \leftarrow non unified.
 cannot be possible because of infinite expression

29/10/2025
CLASSMATE
Date _____
Page _____

3. $H(x, g(z))$
 $H(g(y), g(g(z)))$

$\rightarrow x \neq g(y)$
 \rightarrow x substituted as $g(y)$
 $\rightarrow g(x) \neq g(g(z))$
 $\rightarrow x \neq g(z)$
 $\rightarrow g(y) \neq g(z)$
 $y \neq z$
 y substituted as z

$H(x/g(y), y/z) \leftarrow$ unified

~~Done~~ ✓ 29/10/25

Algorithm: Unify (T_1, T_2)

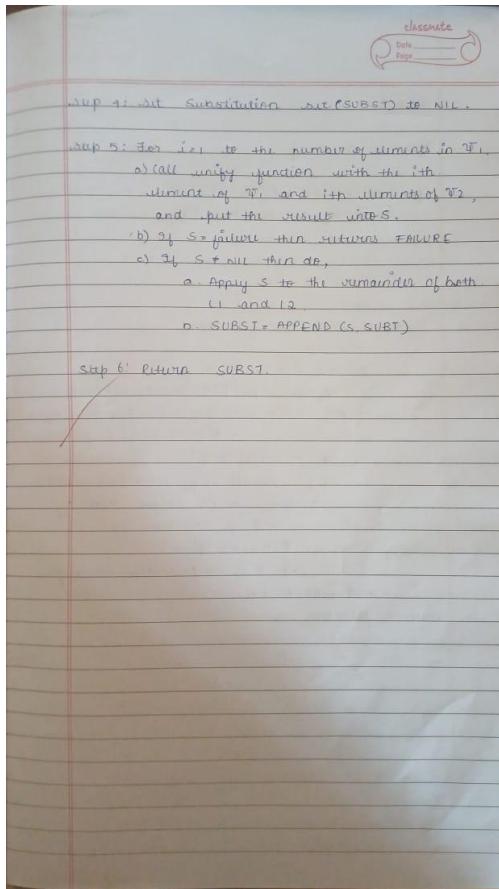

Step 1: If T_1 or T_2 is a variable or constant, then

- a) if T_1 or T_2 are identical, then return NIL.
- b) else if T_1 is a variable,
 a. then if T_1 occurs in T_2 ,
 then return FAILURE.
- c) else if T_2 is a variable,
 a. if T_2 occurs in T_1 , then return FAILURE.
- b. else return S(T_2/T_1).

d) Else return FAILURE.

Step 2: If the unifiable predicate symbol in T_1 and T_2 are not same, then return FAILURE.

Step 3: If T_1 and T_2 share a different number of arguments, then return FAILURE.

Program 10

Implement Alpha-Beta Pruning.

Algorithm:

Block 10

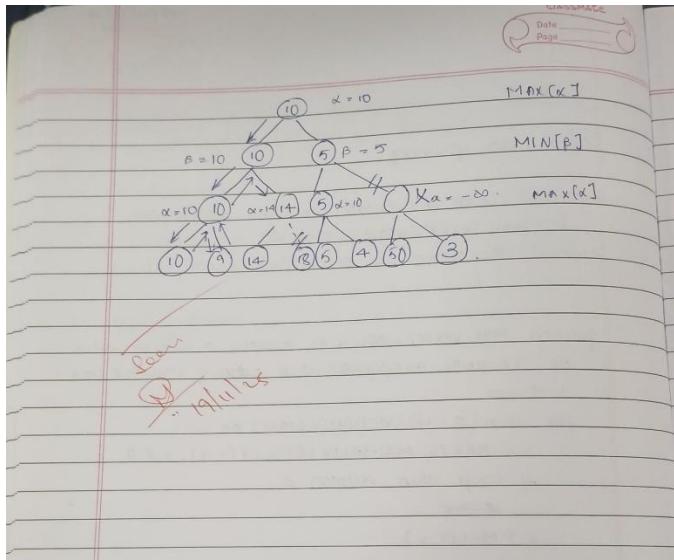

Alpha-beta pruning

```
function ALPHA-BETA(state) returns an action
    v ← MAX-VALUE(state, -∞, +∞)
    return the action in ACTIONS(state) with value v

function MAX-VALUE(state, α, β) returns a utility value
    if TERMINAL-TEST(state) then return UTILITY(state)
    v ← -∞
    for each a in ACTIONS(state) do
        v ← MAX(v, MIN-VALUE(RESULT(s,a), α, β))
        if v ≥ β then return v
    α ← MAX(α, v)
    return v

function MIN-VALUE(state, α, β) returns a utility value
    if TERMINAL-TEST(state) then return UTILITY(state)
    v ← +∞
    for each a in ACTIONS(state) do
        v ← MIN(v, MAX-VALUE(RESULT(s,a), α, β))
        if v ≤ α then return v
    β ← MIN(β, v)
    return v

Output!
Input, leaf nodes: 10 9 19 18 5 4 50 8.
```

Code:

```
